RENEL

Renel provides innovative, complete solutions for energy and electromechanical projects and services. With an emphasis on the industrial, energy and building sectors, it designs and implements cost-effective proposals for organizations, contributing to the improvement of business efficiency and the promotion of the business vision.

For its photovoltaic projects in Greece, Renel chooses K2 Security to meet its security needs from 2019, as our cooperation provides high-know-how projects and integrated solutions related to development, design, the construction and maintenance of energy systems.

Each project demands complete studies for the installation of alarm systems and closed monitoring system of the whole installation with CCTV circuits and automations. We use advanced technology cameras with video analytics capabilities. In addition, all photovoltaic stations are connected to the Signal Reception Center of our company, therefore the respective project is monitored in real time during its construction and subsequent operation.
